PUBLIC HEALTH REPORTS

VOL. 41

OCTOBER 15, 1926

NO. 42

DEATH RATE FROM TUBERCULOSIS DECREASING

Lower death rates from tuberculosis (all forms) were registered in 1924 than in 1900, for each age period for both sexes, in the Registration States of 1900, as shown by figures recently issued by the Department of Commerce. The amount of this decline in death rates ranged from 73 per cent for females under 1 year of age to 37 per cent for females aged 15 to 19 years. Specific rates per 100,000 population at each age period are given in the accompanying table.

This decline in tuberculosis death rates is not limited to the United States. Similar declines are recorded in the death rates of England and Wales. A comparison of the 1924 death rates from tuberculosis (all forms) for England and Wales with the corresponding 1924 rates for the United States Registration States of 1900 reveals lower rates in the United States for each age period up to age 55 for each sex. The greatest per cent difference up to age 55 was for males aged 5 to 9 years, the respective rates for the two countries being 37 for England and Wales and 15 for the United States, the latter rate being 59 per cent lower than the rate for England and The least per cent difference up to age 55 was for females aged 20 to 24, the respective rates for the two countries being 153 for England and Wales and 146 for the United States, the latter rate being 19 per cent lower than the rate for England and Wales. Comparisons of the tuberculosis death rates for the two countries for ages above 55 show much lower rates in England and Wales than in this country, so much lower in fact that apparently the only explanation is a tendency in England and Wales to certify at the older ages bronchitis as the cause of death instead of tuberculosis.

Death rates for tuberculosis, by sex and age groups, in the registration States of 1900

	Death rate for tuberculosis (all forms) per 100,000 population in the registration States of 1900

PUBLIC HEALTH ENGINEERING ABSTRACTS

Housing Methods and Death Rate Variations Correlate. The Nation's Health, Vol. 8, No. 6, June 15, 1926, pp. 425-426. (Abstract by A. L. Dopmeyer.)

In this short article are analyzed the results of a study by Dr. A. K. Chalmers (*Proc. Roy. Soc. Med.*, March, 1926, pp. 13-22) to determine the probable effects on the health of the community produced by living in tenements as compared to cottages. The comparison is made between England and Scotland, the general practice of the people of England in the past having been to live in cottages, and that of the people of Scotland to live in tenements.

According to Doctor Chalmers, dwellers in tenements in Scotland show a much higher death rate, particularly from communicable diseases, than people living in cottages in England; in fact, Scotland shows a higher death rate for each sex at all ages. A table shows comparative death rates between Scotland and England, and a specific comparison is made between Manchester, a "city of cottages," and Glasgow for the years between 1914–1922.

Incidentally, England is said to be attempting to relieve its housing shortage by building tenements and Scotland by building cottages, in each case, the method of housing of which the nation knows least.

Pollution of Water Supplies By Wastes from Canneries and Dairies in Iowa. J. H. Buchanan, Associate Professor of Sanitation Chemistry, Iowa State College, Ames, Iowa. Journal American

Water Works Association, Vol. 15, No. 5, May, 1926, pp. 527-530. (Abstract by Sol Pincus.)

The stream-pollution problem of Iowa has become serious owing to the centralization of manufacturing plants producing organic wastes, particularly in the corn-canning industry and in the dairy industry. It is pointed out that the corn-canning and creamery wastes differ from domestic sewage, as the fermentation of considerable quantities of carbohydrates in the former wastes results in very markedly increasing the acidity of the streams. Instances are given in which the corn-canning waste effected an increase of acidity in the stream of nearly one hundred fold. With the creamery wastes the effect of increase of acidity is also encountered, as well as a great increase in organic matter.

The increase in acidity would be an important factor in the suitability of a stream for public water-supply purposes, on account of the corrosive nature of the acid water and the difficulty that would be experienced in the chemical process of purification.

Schenectady Sewage-Treatment Plant Markets Its Sewage Sludge. Anon. Health News, New York State Health Department, Vol. 3, No. 22, May 31, 1926. p. 86. (Abstract by Isador W. Mendelsohn.)

In little over a year 2,500 cubic yards of dried Imhoff tank sludge from the Schenectady (N. Y.) sewage-disposal plant has been sold to the farmers of the county at 10 to 25 cents per load at the plant. The farmers cart the material in trucks and farm wagons, the average haul being 6 miles, the longest 14. All types of crops were benefited and equal success was reported on both sandy and clayey soils.

The plan for selling the sludge is very interesting and can be adapted to other places. It included (1) advertisement of the fertilizer value of the sludge by the local farm bureau association in the local press and the farm bureau periodical; (2) form letters mailed by the bureau to its members; (3) exhibits at meetings of market gardeners; (4) spread of results of analysis of sludge samples by Cornell University among farmers.

COURT DECISIONS RELATING TO PUBLIC HEALTH

City, not county, held liable for expense of free vaccination.—(Michigan Supreme Court; Keho et al. v. Board of Auditors of Bay County, 209 N. W. 163; decided June 7, 1926.) To prevent the spread of smallpox in Bay City, the plaintiffs, who were physicians constituting the board of health of the city, vaccinated approximately 10,000 school children, teachers, and janitors. Their bills were presented to the county board of auditors and disallowed because the auditors were of the opinion that the county was not liable. The circuit

court affirmed the auditors' action and on appeal to the supreme court the judgment of the circuit court was affirmed. The decision of the supreme court was based on section 5096 of the Compiled Laws, 1915, which provided that "the board of health of each city * * may at any time direct its health officer or health physician to offer vaccination * * * with bovine vaccine virus * * * to every child and to all other persons, without cost to the person vaccinated * * * but at the expense of such city * * *."

Meat ordinance construed.—(Colorado Supreme Court; Burtis v. City of Montrose, 247 P. 186; decided May 10, 1926.) A city ordinance prohibited any person from selling, or keeping or offering for sale, any meat not inspected by the city inspector, unless the meat bore the meat inspection brand or mark of the United States Department of Agriculture. The ordinance also fixed the charges for inspection. The supreme court held that, where the meat handled by a person had been inspected and marked by the Federal Government, such person was expressly exempted from the payment of any inspection fee provided by the ordinance.

Tort action against Washington Suburban Sanitary Commission held not maintainable.—(District of Columbia Court of Appeals; Washington Suburban Sanitary Commission v. Magruder, 12 F. (2d) 832; decided May 3, 1926.) The plaintiff in the lower court brought an action for damages against the Washington Suburban Sanitary Commission for personal injuries alleged to have been caused through the negligence of the defendant in constructing and laying a sewer. The court of appeals held that the action could not be maintained because the commission was a governmental agency created by a Maryland law and was without funds or power to raise same for the purpose of paying damages.

Commitment of drug addicts under certain statute not warranted.—
(New York Supreme Court; People ex rel. Sherwood et al. v. City of Buffalo et al., 216 N. Y. S. 468; decided March, 1926.) Where there was no statute making the use of habit-forming drugs unlawful, the supreme court held that the Buffalo city court could not commit persons to a hospital under a statute authorizing such commitment "for unlawfully using" habit-forming drugs. The court also held that such statute did not make the use of habit-forming drugs unlawful.

Migratory livestock act held unconstitutional.—(Colorado Supreme Court; People v. Morgan, 246 P. 1024; decided May 24, 1926.) The migratory livestock act of 1925 provided that "whenever any migratory livestock is driven into or pastured or suffered to range or graze in this State from an adjoining State, the owner thereof or his agent shall 10 days before crossing the State line notify the sheriff of the county into which such entry is made of such entry," and also

required the inspection of such livestock for communicable diseases. The collection of a certain fee for each animal was also prescribed. In a prosecution for a violation of the act, the supreme court in its opinion stated in part as follows:

Section 6 of the above act of the legislature provides, among other things, that it does not affect livestock owned by residents of this State which are ranged a portion of the year in adjoining States, or which are taken for shipment back into this State. By sections 1, 2, and subsequent sections, the act is made to apply to migratory livestock driven into, or suffered to range or graze in, this State from adjoining States. In other words, one rule is made for residents of Colorado and another for nonresidents. If inspection is necessary for the one, it is necessary for the other.

The above discrimination is repugnant to clause 1, section 2, article 4, of the Constitution of the United States, which entitles the citizens of each State to all privileges and immunities of citizens in the several States. It is also contrary to that part of section 1 of the fourteenth amendment to the Constitution of the United States which forbids any State from making or enforcing any law abridging the privileges and immunities of the citizens of the United States.

The court held the entire act to be invalid.

Enjoining of enforcement of slaughterhouse ordinance refused.—
(Texas Court of Civil Appeals; City of Wichita Falls v. Roberson, 283 S. W. 870; decided March 6, 1926.) The plaintiff in the lower court sought to enjoin the enforcement of an ordinance of the city of Wichita Falls relating to slaughterhouses. The ordinance was very detailed and regulated the construction, equipment, and sanitation of slaughterhouses, required the medical examination of employees, and prohibited the use or sale as food of any animal not slaughtered at a place such as prescribed by the ordinance. Other provisions relating to the subject were also contained in the ordinance. The court of civil appeals refused to grant the injunctive relief asked for, and stated as follows in the opinion:

We conclude that it can not be said that the ordinance invoked in this case, as a whole, is void or violative of any constitutional provision invoked, or that plaintiff's petition or the facts proven on the trial come within any exception to the general rule which denies equitable relief from the enforcement of a criminal statute.

Inspection fees, applicable to private meat markets and imposed by city ordinance, held excessive.—(Louisiana Supreme Court; City of Baton Rouge v. Sanchez, 108 So. 552; decided May 3, 1926.) An ordinance of the city of Baton Rouge provided, among other things, for the inspection of private meat markets and fixed the fees for such inspection at a certain amount for each animal, the amount varying with the kind of animal. The fees were on a daily basis, while the markets were inspected about twice a month. The defendant, the owner and operator of a private meat market, refused to pay an amount assessed against him in accordance with the schedule of fees contained in the ordinance, and the city brought suit to recover

the same. The legality of the ordinance was attacked on the ground that the fees, if construed as either a license or a tax, exceeded the maximum limits provided by the State constitution, and also on the ground that the fees were arbitrary, excessive, and exorbitant, and in no way related to the cost of inspection, but were in restraint of trade and an attempt on the part of the city to raise revenue under the guise of the police power. The evidence showed that the fees and charges assessed against the defendant, on a per annum basis, were far in excess of all of his State and parish taxes and licenses. The supreme court decided in favor of the defendant, and the ordinance, in so far as it attempted to impose the stated fees on private meat markets, was annulled. The following are portions from the court's opinion:

We would not be disposed to interfere with the exercise of the discretion vested in the council and to declare the ordinance illegal if it was made to appear that the fees demanded were for regulatory and inspection purposes, even though the city did incidentally derive a small revenue from such fees over and beyond the amount required to cover the cost and expense incident to the regulation and inspection of the markets.

But the fees exacted under the ordinance are so patently out of proportion to, and so obviously in excess of, the amount necessary to meet the expense and cost of the service contemplated, that we are constrained to hold that the city went beyond its police power of regulation and that the exactions demanded constitute a source of revenue, are within the term "license or tax," and exceed the constitutional limitation.

Town ordinance held valid in so far as making it unlawful to permit certain animals to pollute stream used as water supply.—(Utah Supreme Court; Town of Ophir v. Ault, 247 P. 290; decided June 4, 1926.) One of the provisions of an ordinance of the town of Ophir made it unlawful to permit any cattle, horses, sheep, goats, or hogs to pollute any stream of water, used by the inhabitants of the town, anywhere within 10 miles above a point where said water was first taken by the town for domestic purposes. The defendant was charged with violating the above ordinance in that he permitted his sheep to pollute a stream used by the inhabitants of the town as a water supply and of which stream the town was part owner. The supreme court held that the town had statutory authority to enact an ordinance for the protection of its water supply, and that the ordinance in question was valid as far as the offense charged was concerned. The conviction of the defendant in the lower court was affirmed by the supreme court.

Occupational disease held not compensable under workmen's compensation act.—(Texas Commission of Appeals, Section B; Aetna Life Ins. Co. v. Graham et al., 284 S. W. 931; decided June 9, 1926.) As a result of continued exposure to gases, fumes, etc., incident to her work, an employee of a shoe polish manufacturing company contracted tuberculosis and died therefrom. In an action for compensation under the workmen's compensation act, the commission of appeals was of the opinion that recovery could not be had for an occupational or industrial disease. The commission held that the employee in the instant case had suffered no accidental injury, and that, therefore, the claim was not compensable. The commission recommended that judgment be rendered denying compensation, and the supreme court entered judgment as recommended.

THE NOTIFIABLE DISEASES

PREVALENCE DURING 1925 IN CITIES OF 10,000 TO 100,000 POPULATION

The tables shown on the following pages were compiled from data furnished by the health officers of cities. Requests for information were sent to all cities of the United States having 10,000 population or more. The data for cities having more than 100,000 population were published in the Public Health Reports, volume 41, No. 38, September 17, 1926.

The following is a list of the diseases included:

Anthrax.

Cerebrospinal fever.

Chicken pox.

Chicken I

Dengue.

Diphtheria.

Influenza. Lethargic encephalitis.

Malaria.

Measles.

Mumps.

Pellagra.

Pneumonia (all forms).

Poliomyelitis (infantile paralysis).

Rabies in animals.

Rabies in man.

Rocky Mountain spotted fever.

Scarlet fever.

Septic sore throat.

Smallpox.

Tuberculosis (all forms and pulmonary)

Typhoid fever.

Typhus fever.

Whooping cough.

The present article contains reports from cities having between 10,000 and 100,000 population. It is believed that practically all of these cities are included which have records of morbidity from communicable diseases which are of value for statistical purposes.

The populations given and which were used in computing the rates were estimated as of July 1, 1925. Estimates of population by the Bureau of the Census are based upon the assumption that the annual increase in the population of any city since 1920 is equal to the increase between 1910 and 1920 as shown by the returns of the two Federal censuses. This method gives an estimate which is approximately correct for most of the cities. In a few cases, however, where there is reason to believe that the results thus obtained are far from correct, no estimate is made. The number of cases and

deaths occurring from each disease in these cities is given but no rates are computed.

The estimated expectancy, given in the tables for some of the diseases, is the result of an attempt to ascertain from the experience of recent years how many cases of the disease under consideration might be expected in 1925. In most instances the estimated expectancy is the median number of cases reported by the city for the years 1918 to 1924, inclusive. When several epidemics have occurred during these years, or when for other reasons the median is not satisfactory, epidemic years are excluded, and the estimated expectancy is the mean of the number of cases reported for the nonepidemic years. The aim has been to ascertain how many cases of each disease may reasonably be expected in the absence of epidemics.

The column headed "Number of years" shows the number of years for which data are available for each city.

In comparing the figures for 1925 with the estimated expectancy, averages, or with reports for preceding years, it should be borne in mind that there has been a gradual improvement in the reporting of communicable diseases during the last few years. An increase in the number of cases reported may be due to better reporting of the particular disease rather than to an increase in the number of cases existing.

In studying these tables it should be kept in mind that a relatively large number of reported cases of a communicable disease as indicated by a high case rate (and more especially when accompanied by a relatively small number of deaths, as indicated by a low fatality rate) usually means that the health department of that city is active and that the cases of the disease are being well reported by the practicing physicians. It does not usually mean that the disease is more prevalent in that city than in other cities. A high fatality rate may mean that the disease was unusually virulent in a city, that the physicians did not treat the disease in that city with the success usual elsewhere, or that the practicing physicians did not report all of their cases to the health department. On the other hand, an unusually low fatality rate may be due to the fact that the disease in the city was unusually mild, that the physicians treated it with unusual success, that the practicing physicians reported their cases satisfactorily, or that the registration of deaths was incomplete or, the assignment of the causes of death inaccurate.

Cities which did not report either cases or deaths of a certain disease in 1925 are not included in the table for that disease.

Reported Prevalence for the Year 1925

¹ Annual rate per 1,000 population.

² Death under 1 year per 1,000 births. Cities left blank are not in the registration area for births.

³ Data for 64 cities.

⁴ Deaths for week ended Friday, Oct. 1, 1926.

⁴ In the cities for which deaths are shown by color, the colored population in 1920 constituted the following percentages of the total population: a thanta 31, Baltimore 15, Birmingham 39, Dallas 15, Fort Worth 14, Houston 25, Indianapolis 11, Kansas City, Kans. 14, Louisville 17, Memphis 38, Nashville 30, New Orleans 25, Norfolk 38, Richmond 32, and Washington, D. C. 25,

PREVALENCE OF DISEASE

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring

GENERAL CURRENT SUMMARY AND WEEKLY REPORTS FROM CITIES

Diphtheria.—For the week ended September 25, 1926, 38 States reported 1,277 cases of diphtheria. For the week ended September 26, 1925, the same States reported 1,272 cases of this disease. Ninety-six cities, situated in all parts of the country and having an aggregate population of more than 29,600,000, reported 615 cases of diphtheria for the week ended September 25, 1926. Last year for the corresponding week they reported 541 cases. The estimated expectancy for these cities was 786 cases. The estimated expectancy is based on the experience of the last nine years, excluding epidemics.

Measles.—Thirty-seven States reported 793 cases of measles for the week ended September 25, 1926, and 330 cases of this disease for the week ended September 26, 1925. Ninety-six cities reported 211 cases of measles for the week this year, and 193 cases last year.

Poliomyelitis.—The health officers of 38 States reported 117 cases of poliomyelitis for the week ended September 25, 1926. The same States reported 284 cases for the week ended September 26, 1925.

Scarlet fever.—Scarlet fever was reported for the week as follows: Thirty-eight States—this year, 1,235 cases; last year, 1,018 cases; 96 cities—this year, 452 cases; last year, 327 cases; estimated expectancy, 404 cases.

Smallpox.—For the week ended September 25, 1926, 38 States reported 123 cases of smallpox. Last year for the corresponding week they reported 102 cases. Ninety-six cities reported smallpox for the week as follows: 1926, 17 cases; 1925, 31 cases; estimated expectancy, 22 cases. No deaths from smallpox were reported by these cities for the week this year.

Typhoid fever.—One thousand two hundred and thirty-eight cases of typhoid fever were reported for the week ended September 25, 1926, by 38 States. For the corresponding week of 1925, the same States reported 1,222 cases of this disease. Ninety-six cities re-

ported 249 cases of typhoid fever for the week this year and 248 cases for the corresponding week last year. The estimated expectancy for these cities was 221 cases.

Influenza and pneumonia.—Deaths from influenza and pneumonia were reported for the week by 90 cities, with a population of more than 28,900,000 as follows: 1926, 393 deaths; 1925, 295 deaths.

City reports for week ended September 25, 1926

The "estimated expectancy" given for diphtheria, poliomyelitis, scarlet fever, smallpox, and typhoid fever is the result of an attempt to ascertain from previous occurrence how many cases of the disease under consideration may be expected to occur during a certain week in the absence of epidemics. It is based on reports to the Public Health Service during the past nine years. It is in most instances the median number of cases reported in the corresponding week of the preceding years. When the reports include several epidemics or when for other reasons the median is unsatisfactory, the epidemic periods are excluded and the estimated expectancy is the mean number of cases reported for the week during nonepidemic years.

If reports have not been received for the full nine years, data are used for as many years as possible, but no year earlier than 1917 is included. In obtaining the estimated expectancy, the figures are smoothed when necessary to avoid abrupt deviations from the usual trend. For some of the diseases given in the table the available data were not sufficient to make it practicable to compute the estimated expectancy.

The following table gives the rates per 100,000 population for 101 cities for the five-week period ended September 25, 1926, compared with those for a like period ended September 26, 1925. The population figures used in computing the rates are approximate estimates as of July 1, 1925 and 1926, respectively, authoritative figures for many of the cities not being available. The 101 cities reporting cases had an estimated aggregate population of nearly 30,000,000 in 1925 and nearly 30,500,000 in 1926. The 95 cities reporting deaths had more than 29,200,000 estimated population in 1925 and more than 29,730,000 in 1926. The number of, cities included in each group and the estimated aggregate populations are shown in a separate table below.

Summary of weekly reports from cities, August 22 to September 25, 1926-Annual rates per 100,000 population, compared with rates for the corresponding period of 1925 1 DIPHTHERIA CASE RATES

CANADA

Communicable diseases—Week ended September 25, 1926.—The Canadian Ministry of Health reports cases of certain communicable diseases in seven Provinces of Canada for the week ended September 25, 1926 as follows:

Diseases	Nova Scotia	New Bruns- wick	Quebec	Ontario	Mani- toba	Sas- katch- ewan	Alberta	Total
Influenza	8	in the	of the	name		11141	17	11.11%
Lethargic encephalitis				12		2		1
Smallpox Typhoid fever	1	12	4	25	7	4	1	5

Communicable diseases—Ontario—September, 1926 (comparative).— During the month of September, 1926, communicable diseases were reported in the Province of Ontario, Canada, as follows:

Disease		ember, 926		ember, 925
at Mindon Connections	Cases	Deaths	Cases	Deaths
Cerebrospinal meningitis.	4 3		4	1
Chicken pox Diphtheria. German monsles.	123	18	88 271	16
German mousee. Gonorrhea Influenza Lethargic encephalitis.			134	10
Measles Mumps	149 15		59 29	*********
Pneumonia Poliomyeliti Scarlet fev s:	22 141	88	37 162	85
Septic sore throat smallpox Syphilis Fuberculosis	23 89 117	43	25 70 148	62
Puberculosis Typhoid fever. Whooping cough	94 232	3	130 295	8 7

Smallpox.—Smallpox was reported present in the Province of Ontario during the month of September, 1926, in 10 localities. The largest number of cases was reported at Peterboro, viz, 10.

Vital statistics—Quebec—July, 1926.—Births and deaths in the Province of Quebec for the month of July have been reported as follows:

Estimated population	570,000	Deaths from-Continued.	
Births.	6,702	Diph theria	19
Birth rate per 1,000 population	31. 29	Heart diseases	326
Deaths (all causes)	2, 668	Influenza	36
Death rate per 1,000 population	12.45	Measles	25
Deaths under 1 year.	763	- Searlet fever	4
Infant mortality rate	113.84	Syphilis	. 7
Deaths from—	1777	Tuberculosis (pulmonary)	216
Cancer	128	Tuberculosis (other forms)	75
Cerebrospinal meningitis	13	Typhoid fever.	16
Diabetes	26	Whooping cough	30

CHINA

Cholera—Tsingtao—August 30, 1926.—On August 30, 1926, cholera was reported present at Tsingtao, China. The first case was reported in the person of an American, who died of the disease the day after his arrival in the city and is believed to have become infected en route to Tsingtao. The next occurrence was in the Japanese community, with about 10 fatalities. Among the Chinese population from 30 to 40 deaths from cholera were reported daily, the greater number occurring in villages in the immediate vicinity of the city. A second case in a foreigner occurred in a British subject.

Precautions against spread.—Cholera inoculation was administered to the police, military, and civil employees, but was not compulsory; orders were published forbidding use of uncooked food and fruits; quarantine supervision was exercised over arrivals from Amoy, Shanghai, and other ports in south China.

CHOSEN

Cholera—North Heian Province—September 9-16, 1926.—During the period September 9 to 16, 1926, 70 cases of cholera with 30 deaths, estimated, were reported in the North Heian Province, Chosen.

ESTHONIA

Communicable diseases—July, 1926.—During the month of July, 1926, communicable diseases were reported in the Republic of Esthonia as follows: Cases—diphtheria, 36; leprosy, 1; measles, 192; paratyphoid fever, 17; scarlet fever, 169; tuberculosis, 155; typhoid fever, 34. Population, 1,107,059.

in the Republic of Salvado against arrivals from Gustemals on

Smallpox (alastrim)—Other communicable diseases—August 1-28, 1926.—During the period August 1 to 28, 1926, 93 cases of smallpox, reported as alastrim, were reported in the island of Jamaica, occurring at localities other than Kingston. Cases of other communicable diseases were reported as follows:

Disease	King- ston	Other localities	Disease	King- ston	Other localities
Cerebrospinal meningitis Chicken pox Measles Ophthalmia neonatorum Pneumonia	3	1 5 22 1 9	Scarlet fever. Tuberculosis (pulmonary) Typhoid fever. Yaws.	7 9	37 89 2

Small mar, or Very causes of small one were reported and apper Pan and

PANAMA CANAL

Communicable diseases—August, 1926.—During the month of August, 1926, communicable diseases were reported in the Canal Zone and at Colon and Panama, as follows:

Disease	Canal Zone		Colon		Panama		Infected in other locali- ties		Total	
	Cases	Deaths	Cases	Deaths	Cases	Deaths	Cases	Deaths	Cases	Deaths
Diphtheria	1 1		1	*******	13 6 55	1 1 1	2	1	17 7 55
